African Hardwood

Believe it or not, this flute is blown with the nose! Place the opening at the thicker end of the flute against the nostrils; the open mouth is placed around the other hole. The flute has to be pressed against nose and lips. Then blow gently through the nose. The mouth creates a resonating chamber where the sound is formed, and which can be varied by moving the cheeks and tongue. You can thus create funny sounds and even simple melodies. You just have to imagine the melody and automatically the mouth finds the right way to form it. Real fun and it fits in any pocket!

**Plastic Nose Flute:** These models are cheap and easy to clean with water—the ideal type for kids or larger groups.

**Austrian Nose Flute:** This model is precisely carved (especially the labium) and thus produces a clear sound similar to that of a recorder. You can blow precise notes, so it can be used as an adequate musical instrument in classical and folk music. The instrument maker uses different kinds of wood even for one flute to give each flute a character of its own. The different sizes correspond to individual noses. Fabric bag included.

**African Hardwood Nose Flute:** This model is carved in a nice way and is comfortable to play. It can be treated with flute oil. The African Nose Flute is very similar to the Indian type but has a larger range. It is made with great care. As all Flutes are carved by hand, so each one has its own individual sound.
